

TrustLedger

On-chain escrow for serious
freelance work

Draft together. Fund securely. Resolve fairly.

TrustLedger combines encrypted contract drafting, opt-in live collaboration, EVM escrow, juror arbitration, reputation, and notifications in one open-source workflow for clients and freelancers.

1. Draft safely

Share encrypted contract terms first. Start live editing only when both parties are ready.

2. Fund escrow

Lock ETH or ERC-20 payment through auditable smart contract paths.

3. Resolve clearly

Approvals, evidence, juror voting, ratings, and payouts stay traceable.

Encrypted collaboration

Relay services store ciphertext only; session keys stay with users.

Multi-chain foundation

Sepolia-first EVM escrow with Solana Devnet native-program planning.

Strict engineering

React Doctor, Jest, Playwright, Foundry, Docker, Kubernetes, and CI checks.

Wallet-gated drafts

Juror dispute flow

Open-source SaaS infrastructure
